Create perfect custom-fit insoles for your patients

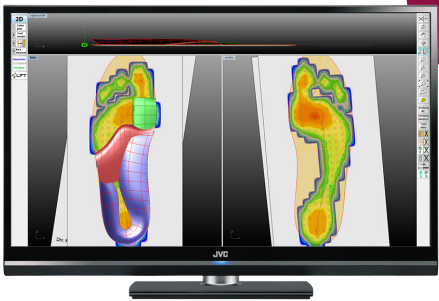

LFT offers foot specialists complete solutions for analysing and treating foot conditions. So that your patients get the perfect custom-fit insoles that will help ease, even eliminate, their foot pain. Our software applications constitute **step 2** within this complete solution.

OrthoPodoManager Central software application

OrthoPodoManager is our multifunctional central software application that is used for fast and simple initiation of personalised insoles.

Device-independent,
the OrthoPodoManager software
works with most scanning
equipment on the market.

Moreover, OrthoPodoManager works seamlessly with existing patient registration software such as Prosoftware, Intramed and Podonet.

OrthoPodo
Manager

With the basic version of OrthoPodoManager you can, amongst other things:

- control the foot scanning equipment (2D foot scanner/3Dfoot scanner/pressure plate);
- record the problem areas based on the scan of each foot and identify the areas where an insole can provide added support;
- identify the wear pattern of the patient's shoe;
- create patient records containing all patient data;
- develop a treatment plan that will help eliminate foot pain;
- initiate an insole plan that will help identify the sole type, desired material, thickness, shore value and even the colour of the covering material, amongst other things;
- simply send the entire order to LFT production facility.

Advanced version

With the advanced version of OrthoPodoManager, you can:

- display patient anamnesis;
- perform patient gait analysis based on photos and video images;
- process findings about the patient in question;
- make a diagnosis;
- document a subsequent check-up, and
- print out reports.

OrthoPodoCAD design software

Have you gathered and translated all the information required about a patient's foot condition into an insole plan using OrthoPodoManager? Then you can create a digital design of the desired personalised insole with OrthoPodoCAD.

Unique predefined libraries

OrthoPodoCAD is our very user-friendly software application that enables you to model any conceivable type of insole digitally, quickly and accurately, down to the millimetre. You decide whether you want to produce an insole based on a 2D, 3D or foot pressure plate scan. After doing so, you can choose an option from our unique, predefined library for podotherapists, orthopaedists, podiatrists and podopostural therapists. You can also create a personal library to store combinations of elements for each patient. These options make it even easier to model personalised insoles.

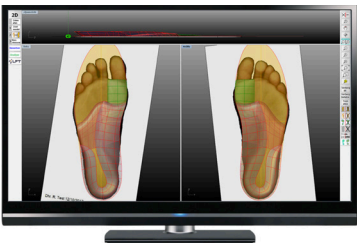

Clear 3D scan result

OrthoPodoCAD offers you a clear 3D scan result you can rotate in any direction with your mouse. After choosing one of the various basic sole patterns, you can accurately position all the elements down to the millimetre. Thus, you can provide added support to the areas of the foot that need it. Are you satisfied with the insole model? If so, simply send the production order to LFT with a click of the mouse.

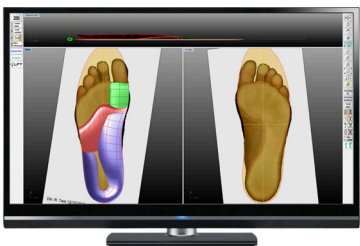

Only 3 minutes to design
completely bespoke insoles

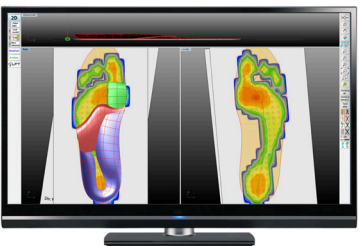

The process

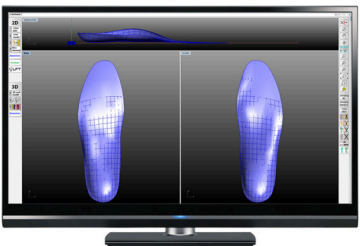

Create scan-based custom-fit insoles for your patients.

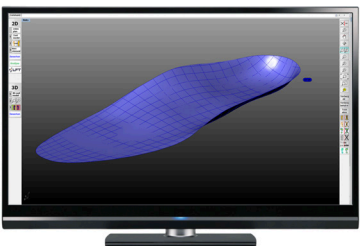

Use default elements from our podiatry, podology and orthopaedics libraries or personal elements

Pressure measurement data can also be used as basis for producing insoles.

We offer you the capabilities to model both 2D and 3D insoles.

The end-result is custom-fit insoles for your patients that will help ease, even eliminate, their foot pain.

Our training programme

At LFT, we offer our products in conjunction with training in the use of the software. This ensures that you and your staff will use our software in the best possible way in the daily activities in your practice. At the end of this training programme, you will also receive a manual with instructions on how to use our software and scanners.

At LFT, you can choose to attend this training at our dedicated workshop facilities on our premises, on site at your practice or even online.

LFT is your trusted knowledge partner and one-stop-shop for products, education and training.
